Introduction (Finite matrix group recognition)

The field approach

Degree steering

Summary

# Matrix group recognition project

Given generators for a matrix group  $G$  over a finite field  $F$ .  
Determine the isomorphism type of  $G$ .

# Matrix group recognition project

Given generators for a matrix group  $G$  over a finite field  $F$ .  
Determine the isomorphism type of  $G$ .

Usually:  $G$  too big to enumerate elements or representatives in subgroup chain. (Typical :  $|F| \leq 1000$ , degree  $\leq 100$ .)

# Matrix group recognition project

Given generators for a matrix group  $G$  over a finite field  $F$ .  
Determine the isomorphism type of  $G$ .

Usually:  $G$  too big to enumerate elements or representatives in subgroup chain. (Typical :  $|F| \leq 1000$ , degree  $\leq 100$ .)

Method (C. Leedham-Green e. a.) : Apply

- ▶ the classification of finite simple groups,
- ▶ general structure theorems for matrix groups
- ▶ what is known about the representation of the finite simple groups

## Easy Example

Typical task: Decide whether a given matrix  $B$  is conjugate to the Kronecker product of two matrices  $X, Y$  of smaller degrees  $n, m$ .

## Easy Example

Typical task: Decide whether a given matrix  $B$  is conjugate to the Kronecker product of two matrices  $X, Y$  of smaller degrees  $n, m$ .

Question ( $n \otimes m$ -problem): What are the resulting conditions for the characteristic polynomial  $\chi_B$  of  $B$ ?

## Easy Example

Typical task: Decide whether a given matrix  $B$  is conjugate to the Kronecker product of two matrices  $X, Y$  of smaller degrees  $n, m$ .

Question ( $n \otimes m$ -problem): What are the resulting conditions for the characteristic polynomial  $\chi_B$  of  $B$ ?

Example:  $2 \otimes 2$ -problem. Let

$$\chi_B(t) := t^4 - b_1 t^3 + b_2 t^2 - b_3 t + b_4$$

be the characteristic polynomial of  $B \in K^{4 \times 4}$ . If  $B$  is the Kronecker product of two matrices  $X, Y \in K^{2 \times 2}$  with

$$\chi_X(t) := t^2 - x_1 t + x_2, \quad \chi_Y(t) := t^2 - y_1 t + y_2.$$

## Example (cont.)

Resulting equations:

$$b_1 = x_1 y_1$$

$$b_2 = -2 x_2 y_2 + y_1^2 x_2 + x_1^2 y_2$$

$$b_3 = y_1 x_2 x_1 y_2$$

$$b_4 = x_2^2 y_2^2$$

## Example (cont.)

Resulting equations:

$$b_1 = x_1 y_1$$

$$b_2 = -2 x_2 y_2 + y_1^2 x_2 + x_1^2 y_2$$

$$b_3 = y_1 x_2 x_1 y_2$$

$$b_4 = x_2^2 y_2^2$$

eliminate  $x_1, x_2, y_1, y_2$  to obtain

$$-b_3^2 + b_1^2 b_4 = 0 \quad (*)$$

as unique generating relation for the  $b_i$ . Hence:

## Example (cont.)

Resulting equations:

$$b_1 = x_1 y_1$$

$$b_2 = -2 x_2 y_2 + y_1^2 x_2 + x_1^2 y_2$$

$$b_3 = y_1 x_2 x_1 y_2$$

$$b_4 = x_2^2 y_2^2$$

eliminate  $x_1, x_2, y_1, y_2$  to obtain

$$-b_3^2 + b_1^2 b_4 = 0 \quad (*)$$

as unique generating relation for the  $b_i$ . Hence:

### Proposition

*$t^4 - b_1 t^3 + b_2 t^2 - b_3 t + b_4$  is characteristic polynomial of a Kroecker product of two  $2 \times 2$ -matrices iff  $(*)$  holds.*

## 2 $\otimes$ 3-problem

Equations:

$$b_1 = x_1 y_1$$

$$b_2 = -2 x_2 y_2 + y_1^2 x_2 + x_1^2 y_2$$

$$b_3 = -3 x_1 x_2 y_3 + y_1 x_2 x_1 y_2 + x_1^3 y_3$$

$$b_4 = -2 x_2^2 y_3 y_1 + x_2 y_1 x_1^2 y_3 + x_2^2 y_2^2$$

$$b_5 = x_2^2 y_3 x_1 y_2$$

$$b_6 = x_2^3 y_3^2$$

### Theorem

*(R. Schwingel 1999)  $t^6 - b_1 t^5 + b_2 t^4 - b_3 t^3 + b_4 t^2 - b_5 t + b_6$  is characteristic polynomial of a Kroecker product of a  $2 \times 2$ -matrix with a  $3 \times 3$ -matrix iff certain 16 polynomials in the  $b_i$  are satisfied of degrees between 19 and 30, where  $\deg(b_i) := i$ .*

# General context for matrix group recognition:

## Problem

*Given a classical group  $G$  defined over a field  $K$  of characteristic zero and any finite dimensional representation  $\rho$  of  $G$ .*

*Find a generating set of the polynomial relations for the coefficients of the characteristic polynomial  $\chi_{\rho(g)}(t)$  of  $\rho(g)$ ,  $g \in G$ .*

# General context for matrix group recognition:

## Problem

*Given a classical group  $G$  defined over a field  $K$  of characteristic zero and any finite dimensional representation  $\rho$  of  $G$ .*

*Find a generating set of the polynomial relations for the coefficients of the characteristic polynomial  $\chi_{\rho(g)}(t)$  of  $\rho(g)$ ,  $g \in G$ .*

Rough measures for difficulty:

- 1.) Krull dimension (= rank of the classical group, e.g.  $n - 1$  for  $SL(n, K)$ ). (At present Krull dimension 5 with good luck doable.)
- 2.) Degree of representation (= number of variables).

# General context for matrix group recognition (cont.):

## Example

1.)  $n \otimes m$ -problem :  $G = \mathrm{GL}(n, K) \times \mathrm{GL}(m, K)$  (resp.  $G = \mathrm{SL}(n, K) \times \mathrm{SL}(m, K)$ ) and  $\rho(X, Y) := X \otimes Y$ .

# General context for matrix group recognition (cont.):

## Example

1.)  $n \otimes m$ -problem :  $G = \mathrm{GL}(n, K) \times \mathrm{GL}(m, K)$  (resp.  $G = \mathrm{SL}(n, K) \times \mathrm{SL}(m, K)$ ) and  $\rho(X, Y) := X \otimes Y$ .

2.) (Tensor square)  $G = \mathrm{GL}(n, K)$  (resp.  $\mathrm{SL}(n, K)$ ) and  $\rho(X) = X \otimes X$ .

# General context for matrix group recognition (cont.):

## Example

1.)  $n \otimes m$ -problem :  $G = \mathrm{GL}(n, K) \times \mathrm{GL}(m, K)$  (resp.  $G = \mathrm{SL}(n, K) \times \mathrm{SL}(m, K)$ ) and  $\rho(X, Y) := X \otimes Y$ .

2.) (Tensor square)  $G = \mathrm{GL}(n, K)$  (resp.  $\mathrm{SL}(n, K)$ ) and  $\rho(X) = X \otimes X$ .

3.) (Compound representation)  $G = \mathrm{GL}(n, K)$  (resp.  $\mathrm{SL}(n, K)$ ) and  $\rho(X) = \wedge^k X$  for  $k \leq n$ .

# General context for matrix group recognition (cont.):

## Example

- 1.)  *$n \otimes m$ -problem* :  $G = \text{GL}(n, K) \times \text{GL}(m, K)$  (resp.  $G = \text{SL}(n, K) \times \text{SL}(m, K)$ ) and  $\rho(X, Y) := X \otimes Y$ .
- 2.) *(Tensor square)*  $G = \text{GL}(n, K)$  (resp.  $\text{SL}(n, K)$ ) and  $\rho(X) = X \otimes X$ .
- 3.) *(Compound representation)*  $G = \text{GL}(n, K)$  (resp.  $\text{SL}(n, K)$ ) and  $\rho(X) = \wedge^k X$  for  $k \leq n$ .
- 4.) *(Exterior and (reduced) symmetric square)*  $G = \text{SO}(n, K)$  and  $\rho$  certain constituents of the tensor square.

Note: These series are excellent for benchmarks!

## Easy Example: Tensor square, $n = 2$ :

$$b_1 = x_1^2$$

$$b_2 = -2x_2^2 + 2x_1^2x_2$$

$$b_3 = x_1^2x_2^2$$

$$b_4 = x_2^4$$

## Easy Example: Tensor square, $n = 2$ :

$$b_1 = x_1^2$$

$$b_2 = -2x_2^2 + 2x_1^2x_2$$

$$b_3 = x_1^2x_2^2$$

$$b_4 = x_2^4$$

After elimination:

$$b_1^2b_4 - b_3^2, \quad b_2^2b_3 - 4b_1b_3^2 + 4b_1b_2b_4 + 4b_3b_4,$$

$$b_1b_2^2 - 4b_1^2b_3 + 4b_2b_3 + 4b_1b_4, \quad b_1^2b_2b_4 - b_2b_3^2,$$

$$b_2^3b_3 - 4b_1b_2b_3^2 + 16b_3^3 - 12b_2b_3b_4 - 16b_1b_4^2,$$

$$b_2^4 - 16b_1^2b_3^2 + 32b_2b_3^2 - 8b_2^2b_4 + 16b_4^2,$$

$$b_1^2b_2^2 - 4b_1^3b_3 + 4b_1b_2b_3 + 4b_3^2$$

# Outline

Introduction (Finite matrix group recognition)

The field approach

Degree steering

Summary

## Abstract problem:

Given: A field  $K$  and  $n$  variables  $x_1, \dots, x_n$  and  $m$  polynomials

$$y_i = p_i(x_1, \dots, x_n) \in K[x_1, \dots, x_n] \quad \text{for } i = 1, \dots, m. \quad (1)$$

Aim: Find a presentation for the subring  $K[y] := K[y_1, \dots, y_m]$  of  $K[x] := K[x_1, \dots, x_n]$ .

## Abstract problem:

Given: A field  $K$  and  $n$  variables  $x_1, \dots, x_n$  and  $m$  polynomials

$$y_i = p_i(x_1, \dots, x_n) \in K[x_1, \dots, x_n] \quad \text{for } i = 1, \dots, m. \quad (1)$$

Aim: Find a presentation for the subring  $K[y] := K[y_1, \dots, y_m]$  of  $K[x] := K[x_1, \dots, x_n]$ .

Invariants: The difference of  $m$  and the *transcendence degree* of  $K(y) := K(y_1, \dots, y_m)$  over  $K$  will be called the *deficiency*  $d = d(y)$  of the tuple  $y$  in  $K(x)$ .

## Abstract problem:

Given: A field  $K$  and  $n$  variables  $x_1, \dots, x_n$  and  $m$  polynomials

$$y_i = p_i(x_1, \dots, x_n) \in K[x_1, \dots, x_n] \quad \text{for } i = 1, \dots, m. \quad (1)$$

Aim: Find a presentation for the subring  $K[y] := K[y_1, \dots, y_m]$  of  $K[x] := K[x_1, \dots, x_n]$ .

Invariants: The difference of  $m$  and the *transcendence degree* of  $K(y) := K(y_1, \dots, y_m)$  over  $K$  will be called the *deficiency*  $d = d(y)$  of the tuple  $y$  in  $K(x)$ .

Assumption:  $K$  perfect, so that the deficiency  $d(y)$  can be computed from the rank of the Jacobian matrix  $J := \left(\frac{\partial y_i}{\partial x_j}\right) \in K(x)^{m \times n}$ , viz.  $d(y) = m - \text{rank}(J)$ .

# Elimination via field extension

Technical assumption:  $[K(x) : K(y)]$  is a finite field extension.

# Elimination via field extension

Technical assumption:  $[K(x) : K(y)]$  is a finite field extension.

## Algorithm

Input: Equations (1).

Output: Field presentation for  $K(y)$

# Elimination via field extension

Technical assumption:  $[K(x) : K(y)]$  is a finite field extension.

## Algorithm

Input: Equations (1).

Output: Field presentation for  $K(y)$

Algorithm: Step 0: Choose maximal algebraically independent subset of the  $y_i$ , e. g.  $\{y_1, \dots, y_n\}$ , and define  $K_0 := K(y_1, \dots, y_n)$ .

# Elimination via field extension

Technical assumption:  $[K(x) : K(y)]$  is a finite field extension.

## Algorithm

Input: Equations (1).

Output: Field presentation for  $K(y)$

Algorithm: Step 0: Choose maximal algebraically independent subset of the  $y_i$ , e. g.  $\{y_1, \dots, y_n\}$ , and define

$K_0 := K(y_1, \dots, y_n)$ .

Step  $i$ : Find a presentation for  $K_i := K_{i-1}(y_{n+i})$  by computing the minimal polynomial of  $y_{n+i}$  over  $K_{i-1}$ .

# Elimination via field extension

Technical assumption:  $[K(x) : K(y)]$  is a finite field extension.

## Algorithm

Input: Equations (1).

Output: Field presentation for  $K(y)$

Algorithm: Step 0: Choose maximal algebraically independent subset of the  $y_i$ , e. g.  $\{y_1, \dots, y_n\}$ , and define

$K_0 := K(y_1, \dots, y_n)$ .

Step  $i$ : Find a presentation for  $K_i := K_{i-1}(y_{n+i})$  by computing the minimal polynomial of  $y_{n+i}$  over  $K_{i-1}$ .

Note: We can now check any relation among the  $y_i$ , can even generate relations, but have no  $K$ -algebra presentation of  $K[y]$ .

# From field to ring presentation

First idea: Define an ascending chain of ideals

$$I_0 \subsetneq I_1 \subsetneq \dots \subsetneq I_f \trianglelefteq K[Y_1, \dots, Y_m]$$

such that  $I_0$  is generated by the numerators of the relations for the presentation of  $K(y)$  and  $K[Y_1, \dots, Y_m]/I_f \cong K[y]$  as follows:

# From field to ring presentation

First idea: Define an ascending chain of ideals

$$I_0 \subsetneq I_1 \subsetneq \dots \subsetneq I_f \trianglelefteq K[Y_1, \dots, Y_m]$$

such that  $I_0$  is generated by the numerators of the relations for the presentation of  $K(y)$  and  $K[Y_1, \dots, Y_m]/I_f \cong K[y]$  as follows:

Run the Janet-Algorithm twice for  $I_i$ ,

- ▶ over  $K$  to obtain  $K[Y]/I_i$
- ▶ and over  $K(y_1, \dots, y_n)$  to see which denominators  $d \in K[Y_1, \dots, Y_m]$  turn up
- ▶ enlarge  $I_i$  to  $I_{i+1}$  by the kernel of the multiplication with  $d$  on  $K[Y_1, \dots, Y_m]/I_i$ , in case it is not injective.

# From field to ring presentation

First idea: Define an ascending chain of ideals

$$I_0 \subsetneq I_1 \subsetneq \dots \subsetneq I_f \trianglelefteq K[Y_1, \dots, Y_m]$$

such that  $I_0$  is generated by the numerators of the relations for the presentation of  $K(y)$  and  $K[Y_1, \dots, Y_m]/I_f \cong K[y]$  as follows:

Run the Janet-Algorithm twice for  $I_i$ ,

- ▶ over  $K$  to obtain  $K[Y]/I_i$
- ▶ and over  $K(y_1, \dots, y_n)$  to see which denominators  $d \in K[Y_1, \dots, Y_m]$  turn up
- ▶ enlarge  $I_i$  to  $I_{i+1}$  by the kernel of the multiplication with  $d$  on  $K[Y_1, \dots, Y_m]/I_i$ , in case it is not injective.

Stop, when all kernels are trivial.

## From field to ring presentation (discussion)

- ▶ The problem is a very special case of a primary decomposition.

## From field to ring presentation (discussion)

- ▶ The problem is a very special case of a primary decomposition.
- ▶ For big examples, i. e.  $n > 2$  it is too slow.

## From field to ring presentation (discussion)

- ▶ The problem is a very special case of a primary decomposition.
- ▶ For big examples, i. e.  $n > 2$  it is too slow.
- ▶ The method and some variations of it can be used to find relators, which can be used to speed up other approaches.

## From field to ring presentation (discussion)

- ▶ The problem is a very special case of a primary decomposition.
- ▶ For big examples, i. e.  $n > 2$  it is too slow.
- ▶ The method and some variations of it can be used to find relators, which can be used to speed up other approaches.
- ▶ Specialization techniques can be used to find good choices for the maximally algebraically independent  $y_i$ .

## Example: Degrees for $3 \otimes 3$ -problem

For the  $3 \otimes 3$ -problem one has (in the end) Krull dimension  $n = 5$  and  $m = 9$ .

## Example: Degrees for $3 \otimes 3$ -problem

For the  $3 \otimes 3$ -problem one has (in the end) Krull dimension  $n = 5$  and  $m = 9$ .

Any 5-element subset  $S \subset \{y_1, \dots, y_9\}$  is algebraically independent.

## Example: Degrees for $3 \otimes 3$ -problem

For the  $3 \otimes 3$ -problem one has (in the end) Krull dimension  $n = 5$  and  $m = 9$ .

Any 5-element subset  $S \subset \{y_1, \dots, y_9\}$  is algebraically independent.

By specialization one gets rather quickly the following degrees  $[K(y) : K(y_i | y_i \in S)]$ :

$$6, 9, 10, 11(2\times), 12(13\times), \dots, 54, \dots, 108(4\times), 126(5\times).$$

**Degree steering**

Summary

## Degree steering: basics

The most powerful method is similar to Groebner walks and is based on the following easy to prove lemma.

### Lemma

*Let  $J \subseteq K[X_1, \dots, X_n, Y_1, \dots, Y_m]$  be a Janet basis with respect to some term ordering. For any  $0 \neq p \in K[X_1, \dots, X_n, Y_1, \dots, Y_m]$  let  $\lambda(p)$  be its leading monomial. If*

$$J \cap K[Y_1, \dots, Y_m] = \{p \in J \mid \lambda(p) \in K[Y_1, \dots, Y_m]\},$$

*then  $J \cap K[Y_1, \dots, Y_m]$  generates  $\langle J \rangle \cap K[Y_1, \dots, Y_m]$ .*

# Degree steering: algorithm

## Algorithm

*Input: A non-empty finite subset*  
 $\overline{N} \subseteq K[X_1, \dots, X_n, Y_1, \dots, Y_m]$ .

# Degree steering: algorithm

## Algorithm

*Input: A non-empty finite subset*

$\overline{N} \subseteq K[X_1, \dots, X_n, Y_1, \dots, Y_m]$ .

*Output: A subset  $M \subseteq K[Y_1, \dots, Y_m]$  generating*

$\langle \overline{N} \rangle \cap K[Y_1, \dots, Y_m]$ .

# Degree steering: algorithm

## Algorithm

*Input: A non-empty finite subset*

$N \subseteq K[X_1, \dots, X_n, Y_1, \dots, Y_m]$ .

*Output: A subset  $M \subseteq K[Y_1, \dots, Y_m]$  generating*

$\langle N \rangle \cap K[Y_1, \dots, Y_m]$ .

*Algorithm: Run Janet's algorithm for  $N$  over  $K$  with respect to some degree lexicographical term ordering.*

*Keep replacing  $N$  by this Janet basis and changing the term ordering by increasing the degrees of all the  $X_i$  until the criterion of the lemma is satisfied.*

# Degree steering: algorithm

- ▶ Degree steering can be applied in more general situations as described in (1).
- ▶ Degree steering can be accelerated, if one knows already some relations among the  $y_i$ .
- ▶ Degree steering can be used to verify a presentation for the  $y_i$  or to complete it, if necessary.

## Degree steering: example

Critical run for the  $2 \otimes 3$ -problem:  
variables with degrees:

$y_5 : 10,$      $y_4 : 8,$      $y_3 : 6,$      $y_2 : 4,$      $y_1 : 2,$      $x_2 : 2$

## Degree steering: example

Critical run for the  $2 \otimes 3$ -problem:  
variables with degrees:

$y_5 : 10,$      $y_4 : 8,$      $y_3 : 6,$      $y_2 : 4,$      $y_1 : 2,$      $x_2 : 2$

Eliminate  $x_2$  (in less than 2 minutes with GINV):

## Degree steering: example

Critical run for the  $2 \otimes 3$ -problem:  
variables with degrees:

$$y_5 : 10, \quad y_4 : 8, \quad y_3 : 6, \quad y_2 : 4, \quad y_1 : 2, \quad x_2 : 2$$

Eliminate  $x_2$  (in less than 2 minutes with GINV):

Notation:  $J$  involutive Basis,

$$J_{\lambda,y} := \{ p \in J \mid \lambda(p) \in K[Y_1, \dots, Y_m] \},$$

## Degree steering: example

Critical run for the  $2 \otimes 3$ -problem:  
variables with degrees:

$$y_5 : 10, \quad y_4 : 8, \quad y_3 : 6, \quad y_2 : 4, \quad y_1 : 2, \quad x_2 : 2$$

Eliminate  $x_2$  (in less than 2 minutes with GINV):

Notation:  $J$  involutive Basis,

$$J_{\lambda,y} := \{p \in J \mid \lambda(p) \in K[Y_1, \dots, Y_m]\},$$

degree ( $x_2$ )	$ J \cap K[Y] $	$ J_{\lambda,y} $	$ J $
2	0	15	25
11	0	18	109
21	6	19	148
29	21	21	164

# Outline

Introduction (Finite matrix group recognition)

The field approach

Degree steering

Summary

## Summary:

- ▶ Series of test examples for elimination originating from the matrix group recognition project were defined.

## Summary:

- ▶ Series of test examples for elimination originating from the matrix group recognition project were defined.
- ▶ Two approaches to carry out the elimination were described.

## Summary:

- ▶ Series of test examples for elimination originating from the matrix group recognition project were defined.
- ▶ Two approaches to carry out the elimination were described.
- ▶ The first approach (elimination via field extensions) generates some relations quickly and gives an estimate of the difficulty of the problem.

## Summary:

- ▶ Series of test examples for elimination originating from the matrix group recognition project were defined.
- ▶ Two approaches to carry out the elimination were described.
- ▶ The first approach (elimination via field extensions) generates some relations quickly and gives an estimate of the difficulty of the problem.
- ▶ The second approach (degree steering) is a powerful tool for general elimination.

## Summary:

- ▶ Series of test examples for elimination originating from the matrix group recognition project were defined.
- ▶ Two approaches to carry out the elimination were described.
- ▶ The first approach (elimination via field extensions) generates some relations quickly and gives an estimate of the difficulty of the problem.
- ▶ The second approach (degree steering) is a powerful tool for general elimination.
- ▶ Both methods build on involutive division and have been tested using GINV.

## Summary:

- ▶ Series of test examples for elimination originating from the matrix group recognition project were defined.
- ▶ Two approaches to carry out the elimination were described.
- ▶ The first approach (elimination via field extensions) generates some relations quickly and gives an estimate of the difficulty of the problem.
- ▶ The second approach (degree steering) is a powerful tool for general elimination.
- ▶ Both methods build on involutive division and have been tested using GINV.
- ▶ The first few problems in each series were solved using GINV.
