540/604

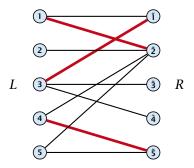

Matching

- Input: undirected graph G = (V, E).
- $M \subseteq E$ is a matching if each node appears in at most one edge in M.
- Maximum Matching: find a matching of maximum cardinality

Bipartite Matching

- ▶ Input: undirected, bipartite graph $G = (L \uplus R, E)$.
- $M \subseteq E$ is a matching if each node appears in at most one edge in M.
- Maximum Matching: find a matching of maximum cardinality

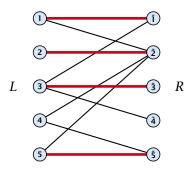

16 Definition

Bipartite Matching

- ▶ Input: undirected, bipartite graph $G = (L \uplus R, E)$.
- $M \subseteq E$ is a matching if each node appears in at most one edge in M.
- Maximum Matching: find a matching of maximum cardinality

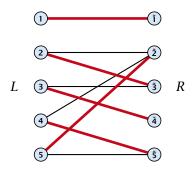

16 Definition

Bipartite Matching

- A matching *M* is perfect if it is of cardinality |M| = |V|/2.
- ► For a bipartite graph $G = (L \uplus R, E)$ this means |M| = |L| = |R| = n.

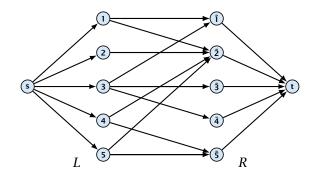

16 Definition

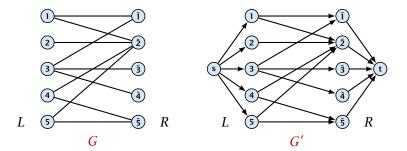

17 Bipartite Matching via Flows

- ▶ Input: undirected, bipartite graph $G = (L \uplus R \uplus \{s, t\}, E')$.
- Direct all edges from L to R.
- Add source *s* and connect it to all nodes on the left.
- Add *t* and connect all nodes on the right to *t*.
- All edges have unit capacity.

Max cardinality matching in $G \leq$ value of maxflow in G'

- Given a maximum matching *M* of cardinality *k*.
- Consider flow *f* that sends one unit along each of *k* paths.
- f is a flow and has cardinality k.

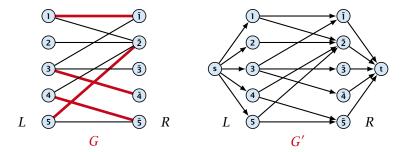

17 Bipartite Matching via Flows

Max cardinality matching in $G \leq$ value of maxflow in G'

- f is a flow and has cardinality k.

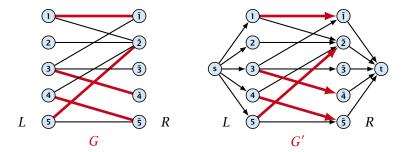

17 Bipartite Matching via Flows

Max cardinality matching in $G \ge$ value of maxflow in G'

- Let f be a maxflow in G' of value k
- Integrality theorem $\Rightarrow k$ integral; we can assume f is 0/1.
- Consider M= set of edges from L to R with f(e) = 1.
- Each node in *L* and *R* participates in at most one edge in *M*.
- |M| = k, as the flow must use at least k middle edges.

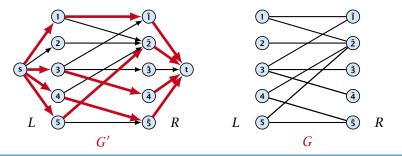

17 Bipartite Matching via Flows

Which flow algorithm to use?

- Generic augmenting path: $\mathcal{O}(m \operatorname{val}(f^*)) = \mathcal{O}(mn)$.
- Capacity scaling: $\mathcal{O}(m^2 \log C) = \mathcal{O}(m^2)$.

17 Bipartite Matching via Flows

Definitions.

- Given a matching *M* in a graph *G*, a vertex that is not incident to any edge of *M* is called a free vertex w.r..t. *M*.
- ▶ For a matching *M* a path *P* in *G* is called an alternating path if edges in *M* alternate with edges not in *M*.
- An alternating path is called an augmenting path for matching M if it ends at distinct free vertices.

Theorem 1

A matching M is a maximum matching if and only if there is no augmenting path w. r. t. M.

Proof.

- ⇒ If *M* is maximum there is no augmenting path *P*, because we could switch matching and non-matching edges along *P*. This gives matching $M' = M \oplus P$ with larger cardinality.
- \Leftarrow Suppose there is a matching M' with larger cardinality. Consider the graph H with edge-set $M' \oplus M$ (i.e., only edges that are in either M or M' but not in both).

Each vertex can be incident to at most two edges (one from M and one from M'). Hence, the connected components are alternating cycles or alternating path.

As |M'| > |M| there is one connected component that is a path P for which both endpoints are incident to edges from M'. P is an alternating path.

Proof.

- ⇒ If M is maximum there is no augmenting path P, because we could switch matching and non-matching edges along P. This gives matching M' = M ⊕ P with larger cardinality.
- $\Leftarrow Suppose there is a matching M' with larger cardinality.$ $Consider the graph H with edge-set <math>M' \oplus M$ (i.e., only edges that are in either M or M' but not in both).

Each vertex can be incident to at most two edges (one from M and one from M'). Hence, the connected components are alternating cycles or alternating path.

As |M'| > |M| there is one connected component that is a path P for which both endpoints are incident to edges from M'. P is an alternating path.

Proof.

- ⇒ If M is maximum there is no augmenting path P, because we could switch matching and non-matching edges along P. This gives matching M' = M ⊕ P with larger cardinality.
- $\leftarrow Suppose there is a matching M' with larger cardinality. Consider the graph H with edge-set M' \oplus M (i.e., only edges that are in either M or M' but not in both).$

Each vertex can be incident to at most two edges (one from M and one from M'). Hence, the connected components are alternating cycles or alternating path.

As |M'| > |M| there is one connected component that is a path P for which both endpoints are incident to edges from M'. P is an alternating path.

Algorithmic idea:

As long as you find an augmenting path augment your matching using this path. When you arrive at a matching for which no augmenting path exists you have a maximum matching.

Theorem 2

Let G be a graph, M a matching in G, and let u be a free vertex w.r.t. M. Further let P denote an augmenting path w.r.t. M and let $M' = M \oplus P$ denote the matching resulting from augmenting M with P. If there was no augmenting path starting at u in M then there is no augmenting path starting at u in M'.

19 Weighted Bipartite Matching

Weighted Bipartite Matching/Assignment

- Input: undirected, bipartite graph $G = L \cup R, E$.
- an edge $e = (\ell, r)$ has weight $w_e \ge 0$
- find a matching of maximum weight, where the weight of a matching is the sum of the weights of its edges

Simplifying Assumptions (wlog [why?]):

- assume that |L| = |R| = n
- ► assume that there is an edge between every pair of nodes $(\ell, r) \in V \times V$

Weighted Bipartite Matching

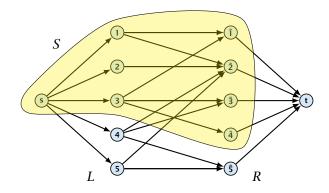

Theorem 3 (Halls Theorem)

A bipartite graph $G = (L \cup R, E)$ has a perfect matching if and only if for all sets $S \subseteq L$, $|\Gamma(S)| \ge |S|$, where $\Gamma(S)$ denotes the set of nodes in R that have a neighbour in S.

19 Weighted Bipartite Matching

19 Weighted Bipartite Matching

- Of course, the condition is necessary as otherwise not all nodes in S could be matched to different neighbours.
- ⇒ For the other direction we need to argue that the minimum cut in the graph G' is at least |L|.
 - Let S denote a minimum cut and let $L_S \cong L \cap S$ and $R_S \cong R \cap S$ denote the portion of S inside L and R_S respectively.
 - Clearly, all neighbours of nodes in *Ly* have to be in *S*, as otherwise we would cut an edge of infinite capacity.
 - This gives $R_S \geq |\Gamma(L_S)|$.
 - The size of the cut is $|L| |L_S| + |R_S|$.
 - Using the fact that $|\Gamma(L_S)| \ge L_S$ gives that this is at least |L|

Idea:

We introduce a node weighting \vec{x} . Let for a node $v \in V$, $x_v \ge 0$ denote the weight of node v.

Suppose that the node weights dominate the edge-weights in the following sense: $(u, u) = n \cosh u \cosh u \cosh u$

- Let $B(\mathcal{R})$ denote the subgraph of G that only contains edges that are seen w.r.t. the node weighting \mathcal{L}_i i.e. edges e = (u, v) for which $w_i = x_i + x_i$.
- Try to compute a perfect matching in the subgraph *H*(*X*). If you are successful you found an optimal matching:

19 Weighted Bipartite Matching

Idea:

We introduce a node weighting \vec{x} . Let for a node $v \in V$, $x_v \ge 0$ denote the weight of node v.

Suppose that the node weights dominate the edge-weights in the following sense:

 $x_u + x_v \ge w_e$ for every edge e = (u, v).

- Let $H(\vec{x})$ denote the subgraph of *G* that only contains edges that are tight w.r.t. the node weighting \vec{x} , i.e. edges e = (u, v) for which $w_e = x_u + x_v$.
- Try to compute a perfect matching in the subgraph $H(\vec{x})$. If you are successful you found an optimal matching.

- Try to compute a perfect matching in the subgraph $H(\vec{x})$. If you are successful you found an optimal matching.

Reason:

• The weight of your matching M^* is

$$\sum_{(u,v)\in M^*} w_{(u,v)} = \sum_{(u,v)\in M^*} (x_u + x_v) = \sum_v x_v .$$

Any other matching M has

$$\sum_{(u,v)\in M} w_{(u,v)} \leq \sum_{(u,v)\in M} (x_u + x_v) \leq \sum_v x_v .$$

19 Weighted Bipartite Matching

What if you don't find a perfect matching?

Then, Halls theorem guarantees you that there is a set $S \subseteq L$, with $|\Gamma(S)| < |S|$, where Γ denotes the neighbourhood w.r.t. the subgraph $H(\vec{x})$.

Idea: reweight such that:

- the total weight assigned to nodes decreases
- the weight function still dominates the edge-weights

If we can do this we have an algorithm that terminates with an optimal solution (we analyze the running time later).

- Hence, reweighting does not decrease the size of a maximum matching in the tight sub-graph.

- One reweighting step increases the number of edges out of S by at least one.
- Assume that we have a maximum matching that saturates the set $\Gamma(S)$, in the sense that every node in $\Gamma(S)$ is matched to a node in *S* (we will show that we can always find *S* and a matching such that this holds).
- ► This matching is still contained in the new graph, because all its edges either go between $\Gamma(S)$ and S or between L S and $R \Gamma(S)$.
- Hence, reweighting does not decrease the size of a maximum matching in the tight sub-graph.

- We will show that after at most n reweighting steps the size of the maximum matching can be increased by finding an augmenting path.
- This gives a polynomial running time.

How to find an augmenting path?

Construct an alternating tree.

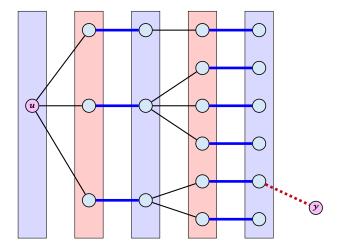

19 Weighted Bipartite Matching

▲ @ ▶ ▲ 볼 ▶ ▲ 볼 ▶ 570/604

- Start on the left and compute an alternating tree, starting at any free node u.
- If this construction stops, there is no perfect matching in the tight subgraph (because for a perfect matching we need to find an augmenting path starting at u).
- The set of even vertices is on the left and the set of odd vertices is on the right and contains all neighbours of even nodes.
- All odd vertices are matched to even vertices. Furthermore, the even vertices additionally contain the free vertex u.
 Hence, |V_{odd}| = |Γ(V_{even})| < |V_{even}|, and all odd vertices are saturated in the current matching.

If the shortest augmenting path w.r.t. a matching M has ℓ edges then the cardinality of the maximum matching is of size at most $|M| + \frac{|V|}{\ell+1}$.

Proof.

The symmetric difference between M and M^* contains $|M^*| - |M|$ vertex-disjoint augmenting paths. Each of these paths contains at least $\ell + 1$ vertices. Hence, there can be at most $\frac{|V|}{\ell+1}$ of them.

20 The Hopcroft-Karp Algorithm

If the shortest augmenting path w.r.t. a matching M has ℓ edges then the cardinality of the maximum matching is of size at most $|M| + \frac{|V|}{\ell+1}$.

Proof.

The symmetric difference between M and M^* contains $|M^*| - |M|$ vertex-disjoint augmenting paths. Each of these paths contains at least $\ell + 1$ vertices. Hence, there can be at most $\frac{|V|}{\ell+1}$ of them.

Lemma 7

The Hopcroft-Karp algorithm requires at most $2\sqrt{|V|}$ phases.

Proof.

- ► After iteration $\lfloor \sqrt{|V|} \rfloor$ the length of a shortest augmenting path must be at least $\lfloor \sqrt{|V|} \rfloor + 1 \ge \sqrt{|V|}$.
- Hence, there can be at most $|V|/(\sqrt{|V|} + 1) \le \sqrt{|V|}$ additional augmentations.

20 The Hopcroft-Karp Algorithm

Lemma 7

The Hopcroft-Karp algorithm requires at most $2\sqrt{|V|}$ phases.

- ► After iteration $\lfloor \sqrt{|V|} \rfloor$ the length of a shortest augmenting path must be at least $\lfloor \sqrt{|V|} \rfloor + 1 \ge \sqrt{|V|}$.
- ► Hence, there can be at most $|V|/(\sqrt{|V|} + 1) \le \sqrt{|V|}$ additional augmentations.

Lemma 8

One phase of the Hopcroft-Karp algorithm can be implemented in time O(m).

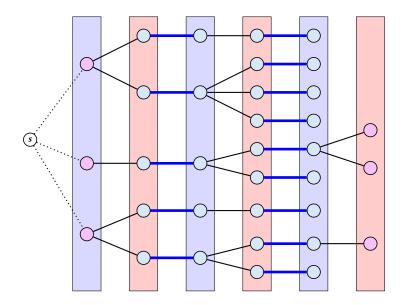

Do a breadth first search starting at all free vertices in the left side L.

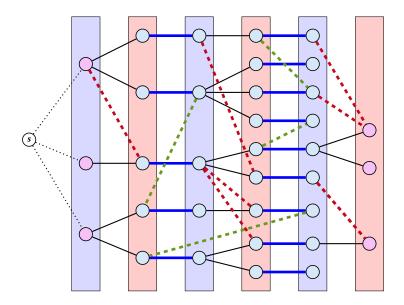

(alternatively add a super-startnode; connect it to all free vertices in L and start breadth first search from there)

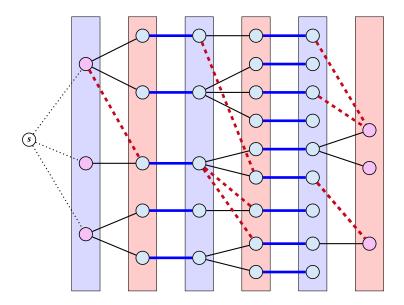

The search stops when reaching a free vertex. However, the current level of the BFS tree is still finished in order to find a set F of free vertices (on the right side) that can be reached via shortest augmenting paths.

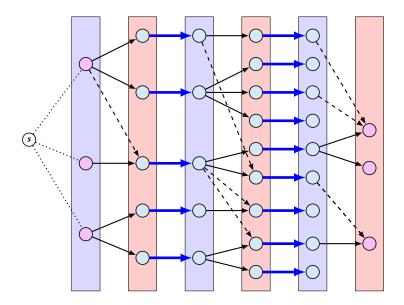

- Then a maximal set of shortest path from the leftmost layer of the tree construction to nodes in F needs to be computed.
- Any such path must visit the layers of the BFS-tree from left to right.
- To go from an odd layer to an even layer it must use a matching edge.
- To go from an even layer to an odd layer edge it can use edges in the BFS-tree or edges that have been ignored during BFS-tree construction.
- We direct all edges btw. an even node in some layer ℓ to an odd node in layer $\ell + 1$ from left to right.
- A DFS search in the resulting graph gives us a maximal set of vertex disjoint path from left to right in the resulting graph.

Definition 9

A flower in a graph G = (V, E) w.r.t. a matching M and a (free) root node r, is a subgraph with two components:

- A stem is an even length alternating path that starts at the root node r and terminates at some node w. We permit the possibility that r = w (empty stem).
- A blossom is an odd length alternating cycle that starts and terminates at the terminal node w of a stem and has no other node in common with the stem. w is called the base of the blossom.

Case 1: non-empty stem

Next suppose that the stem is non-empty.

$$(\mathbf{r}) \cdots (\mathbf{i} \mathbf{b} \mathbf{c}) \mathbf{p}_{3} \mathbf{q}$$

If p' does not contain b it is also an augmenting path in G.

Case 1: non-empty stem

Next suppose that the stem is non-empty.

- After the expansion ℓ must be incident to some node in the blossom. Let this node be k.
- If $k \neq w$ there is an alternating path P_2 from w to k that ends in a matching edge.
- ▶ $P_1 \circ (i, w) \circ P_2 \circ (k, \ell) \circ P_3$ is an alternating path.
- ▶ If k = w then $P_1 \circ (i, w) \circ (w, \ell) \circ P_3$ is an alternating path.

Case 2: empty stem

• If the stem is empty then after expanding the blossom, w = r.

Case 2: empty stem

• If the stem is empty then after expanding the blossom, w = r.

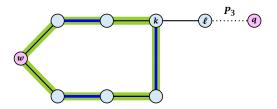

Case 2: empty stem

• If the stem is empty then after expanding the blossom, w = r.

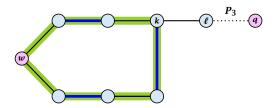

21 Maximum Matching in General Graphs

◆ 個 ト < 注 ト < 注 ト 595/604

Case 2: empty stem

• If the stem is empty then after expanding the blossom, w = r.

• The path $r \circ P_2 \circ (k, \ell) \circ P_3$ is an alternating path.

Lemma 11

If G contains an augmenting path P from r to q w.r.t. matching M then G' contains an augmenting path from r (or the pseudo-node containing r) to q w.r.t. M'.

- If P does not contain a node from B there is nothing to prove.
- We can assume that *r* and *q* are the only free nodes in *G*.

Case 1: empty stem

Let i be the last node on the path P that is part of the blossom.

P is of the form $P_1 \circ (i, j) \circ P_2$, for some node j and (i, j) is unmatched.

 $(b, j) \circ P_2$ is an augmenting path in the contracted network.

- If P does not contain a node from B there is nothing to prove.
- We can assume that *r* and *q* are the only free nodes in *G*.

Case 1: empty stem

Let i be the last node on the path P that is part of the blossom.

P is of the form $P_1 \circ (i, j) \circ P_2$, for some node j and (i, j) is unmatched.

 $(b, j) \circ P_2$ is an augmenting path in the contracted network.

- If P does not contain a node from B there is nothing to prove.
- We can assume that *r* and *q* are the only free nodes in *G*.

Case 1: empty stem

Let i be the last node on the path P that is part of the blossom.

P is of the form $P_1 \circ (i, j) \circ P_2$, for some node j and (i, j) is unmatched.

 $(b, j) \circ P_2$ is an augmenting path in the contracted network.

- If P does not contain a node from B there is nothing to prove.
- We can assume that *r* and *q* are the only free nodes in *G*.

Case 1: empty stem

Let i be the last node on the path P that is part of the blossom.

P is of the form $P_1 \circ (i, j) \circ P_2$, for some node *j* and (i, j) is unmatched.

 $(b, j) \circ P_2$ is an augmenting path in the contracted network.

- If P does not contain a node from B there is nothing to prove.
- We can assume that *r* and *q* are the only free nodes in *G*.

Case 1: empty stem

Let *i* be the last node on the path *P* that is part of the blossom. *P* is of the form $P_1 \circ (i, j) \circ P_2$, for some node *j* and (i, j) is unmatched.

 $(b, j) \circ P_2$ is an augmenting path in the contracted network.

- If P does not contain a node from B there is nothing to prove.
- We can assume that *r* and *q* are the only free nodes in *G*.

Case 1: empty stem

Let *i* be the last node on the path *P* that is part of the blossom. *P* is of the form $P_1 \circ (i, j) \circ P_2$, for some node *j* and (i, j) is unmatched.

 $(b, j) \circ P_2$ is an augmenting path in the contracted network.

- 1: set $\bar{A}(i) \leftarrow A(i)$ for all nodes i
- 2: *found* \leftarrow false
- 3: unlabel all nodes;
- 4: give an even label to r and initialize $list \leftarrow \{r\}$
- 5: while $list \neq \emptyset$ do
- 6: delete a node *i* from *list*
- 7: examine(*i*, *found*)
- 8: **if** *found* = true **then return**

Search for an augmenting path starting at *r*.

- 1: set $\overline{A}(i) \leftarrow A(i)$ for all nodes i
- 2: *found* \leftarrow false
- 3: unlabel all nodes;
- 4: give an even label to r and initialize *list* \leftarrow {r}
- 5: while $list \neq \emptyset$ do
- 6: delete a node *i* from *list*
- 7: examine(*i*, *found*)
- 8: **if** *found* = true **then return**

A(i) contains neighbours of node i.

We create a copy $\bar{A}(i)$ so that we later can shrink blossoms.

- 1: set $\bar{A}(i) \leftarrow A(i)$ for all nodes i
- 2: *found* ← false
- 3: unlabel all nodes;
- 4: give an even label to r and initialize *list* \leftarrow {r}
- 5: while $list \neq \emptyset$ do
- 6: delete a node *i* from *list*
- 7: examine(*i*, *found*)
- 8: **if** *found* = true **then return**

found is just a Boolean that allows to abort the search process...

- 1: set $\bar{A}(i) \leftarrow A(i)$ for all nodes i
- 2: *found* \leftarrow false
- 3: unlabel all nodes;
- 4: give an even label to r and initialize *list* \leftarrow {r}
- 5: while $list \neq \emptyset$ do
- 6: delete a node *i* from *list*
- 7: examine(*i*, *found*)
- 8: **if** *found* = true **then return**

In the beginning no node is in the tree.

- 1: set $\bar{A}(i) \leftarrow A(i)$ for all nodes i
- 2: *found* ← false
- 3: unlabel all nodes;
- 4: give an even label to r and initialize $list \leftarrow \{r\}$
- 5: while $list \neq \emptyset$ do
- 6: delete a node *i* from *list*
- 7: examine(*i*, *found*)
- 8: **if** *found* = true **then return**

Put the root in the tree.

list could also be a set or a stack.

- 1: set $\bar{A}(i) \leftarrow A(i)$ for all nodes i
- 2: *found* \leftarrow false
- 3: unlabel all nodes;
- 4: give an even label to r and initialize *list* \leftarrow {r}
- 5: while $list \neq \emptyset$ do
- 6: delete a node *i* from *list*
- 7: examine(*i*, *found*)
- 8: **if** *found* = true **then return**

As long as there are nodes with unexamined neighbours...

- 1: set $\bar{A}(i) \leftarrow A(i)$ for all nodes i
- 2: *found* ← false
- 3: unlabel all nodes;
- 4: give an even label to r and initialize *list* \leftarrow {r}
- 5: while $list \neq \emptyset$ do
- 6: delete a node *i* from *list*
- 7: examine(*i*, *found*)
- 8: **if** *found* = true **then return**

...examine the next one

- 1: set $\bar{A}(i) \leftarrow A(i)$ for all nodes i
- 2: *found* \leftarrow false
- 3: unlabel all nodes;
- 4: give an even label to r and initialize *list* \leftarrow {r}
- 5: while $list \neq \emptyset$ do
- 6: delete a node *i* from *list*
- 7: examine(*i*, *found*)
- 8: **if** *found* = true **then return**

If you found augmenting path abort and start from next root.

Algorithm 50 examine(*i*, *found*)

1:	for all $j \in \overline{A}(i)$ do
2:	if j is even then contract (i, j) and return
3:	if <i>j</i> is unmatched then
4:	$q \leftarrow j;$
5:	$\operatorname{pred}(q) \leftarrow i;$
6:	<i>found</i> ← true;
7:	return
8:	if <i>j</i> is matched and unlabeled then
9:	$pred(j) \leftarrow i;$
10:	$pred(mate(j)) \leftarrow j;$
11:	add mate (j) to <i>list</i>

Examine the neighbours of a node *i*

Algorithm 50 examine(<i>i</i> , <i>found</i>)		
1: for	r all $j \in \bar{A}(i)$ do	
2:	if j is even then contract (i, j) and return	
3:	if <i>j</i> is unmatched then	
4:	$q \leftarrow j;$	
5:	$\operatorname{pred}(q) \leftarrow i;$	
6:	found \leftarrow true;	
7:	return	
8:	if <i>j</i> is matched and unlabeled then	
9:	$\operatorname{pred}(j) \leftarrow i;$	
10:	$pred(mate(j)) \leftarrow j;$	
11:	add mate (j) to $list$	

For all neighbours *j* do...

Algorithm 50 examine(<i>i</i> , <i>found</i>)		
1: for all $j \in \overline{A}(i)$ do		
2: if j is even then contract (i, j) and return		
3: if <i>j</i> is unmatched then		
4: $q \leftarrow j;$		
5: $\operatorname{pred}(q) \leftarrow i;$		
6: $found \leftarrow true;$		
7: return		
8: if <i>j</i> is matched and unlabeled then		
9: $\operatorname{pred}(j) \leftarrow i;$		
0: $\operatorname{pred}(\operatorname{mate}(j)) \leftarrow j;$		
1: $add mate(j) to list$		

You have found a blossom...

Algorithm 50 examine(<i>i</i> , <i>found</i>)		
1: for all $j \in \overline{A}(i)$ do		
2: if j is even then contract (i, j) and return		
3: if <i>j</i> is unmatched then		
4: $q \leftarrow j;$		
5: $\operatorname{pred}(q) \leftarrow i;$		
6: $found \leftarrow true;$		
7: return		
8: if <i>j</i> is matched and unlabeled then		
9: $\operatorname{pred}(j) \leftarrow i;$		
10: $\operatorname{pred}(\operatorname{mate}(j)) \leftarrow j;$		
add mate (j) to <i>list</i>		

You have found a free node which gives you an augmenting path.

Algo	Algorithm 50 examine(<i>i</i> , <i>found</i>)		
1: f	or all $j \in ar{A}(i)$ do		
2:	if j is even then contract (i, j) and return		
3:	if <i>j</i> is unmatched then		
4:	$q \leftarrow j;$		
5:	$\operatorname{pred}(q) \leftarrow i;$		
6:	<i>found</i> ← true;		
7:	return		
8:	if <i>j</i> is matched and unlabeled then		
9:	$\operatorname{pred}(j) \leftarrow i;$		
10:	$pred(mate(j)) \leftarrow j;$		
11:	add mate (j) to $list$		

If you find a matched node that is not in the tree you grow...

Algorithm 50 examine(*i*, *found*)

1: for all $j \in \overline{A}(i)$ do	
2:	if j is even then contract (i, j) and return
3:	if j is unmatched then
4:	$q \leftarrow j;$
5:	$\operatorname{pred}(q) \leftarrow i;$
6:	<i>found</i> ← true;
7:	return
8:	if j is matched and unlabeled then
9:	$\operatorname{pred}(j) \leftarrow i;$
10:	$pred(mate(j)) \leftarrow j;$
11:	add mate (j) to $list$

mate(j) is a new node from which you can grow further.

- 1: trace pred-indices of i and j to identify a blossom B
- 2: create new node b and set $\bar{A}(b) \leftarrow \bigcup_{x \in B} \bar{A}(x)$
- 3: label *b* even and add to *list*
- 4: update $\bar{A}(j) \leftarrow \bar{A}(j) \cup \{b\}$ for each $j \in \bar{A}(b)$
- 5: form a circular double linked list of nodes in B
- 6: delete nodes in *B* from the graph

Contract blossom identified by nodes i and j

21 Maximum Matching in General Graphs

- 1: trace pred-indices of i and j to identify a blossom B
- 2: create new node b and set $\bar{A}(b) \leftarrow \bigcup_{x \in B} \bar{A}(x)$
- 3: label *b* even and add to *list*
- 4: update $\bar{A}(j) \leftarrow \bar{A}(j) \cup \{b\}$ for each $j \in \bar{A}(b)$
- 5: form a circular double linked list of nodes in B
- 6: delete nodes in *B* from the graph

Get all nodes of the blossom.

Time: $\mathcal{O}(m)$

- 1: trace pred-indices of i and j to identify a blossom B
- 2: create new node *b* and set $\bar{A}(b) \leftarrow \bigcup_{x \in B} \bar{A}(x)$
- 3: label *b* even and add to *list*
- 4: update $\bar{A}(j) \leftarrow \bar{A}(j) \cup \{b\}$ for each $j \in \bar{A}(b)$
- 5: form a circular double linked list of nodes in B
- 6: delete nodes in *B* from the graph

Identify all neighbours of *b*.

Time: $\mathcal{O}(m)$ (how?)

- 1: trace pred-indices of i and j to identify a blossom B
- 2: create new node b and set $\bar{A}(b) \leftarrow \bigcup_{x \in B} \bar{A}(x)$
- 3: label *b* even and add to *list*
- 4: update $\bar{A}(j) \leftarrow \bar{A}(j) \cup \{b\}$ for each $j \in \bar{A}(b)$
- 5: form a circular double linked list of nodes in B
- 6: delete nodes in *B* from the graph

b will be an even node, and it has unexamined neighbours.

- 1: trace pred-indices of i and j to identify a blossom B
- 2: create new node b and set $\bar{A}(b) \leftarrow \bigcup_{x \in B} \bar{A}(x)$
- 3: label *b* even and add to *list*
- 4: update $\bar{A}(j) \leftarrow \bar{A}(j) \cup \{b\}$ for each $j \in \bar{A}(b)$
- 5: form a circular double linked list of nodes in B
- 6: delete nodes in *B* from the graph

Every node that was adjacent to a node in *B* is now adjacent to *b*

- 1: trace pred-indices of i and j to identify a blossom B
- 2: create new node b and set $\bar{A}(b) \leftarrow \bigcup_{x \in B} \bar{A}(x)$
- 3: label *b* even and add to *list*
- 4: update $\bar{A}(j) \leftarrow \bar{A}(j) \cup \{b\}$ for each $j \in \bar{A}(b)$
- 5: form a circular double linked list of nodes in B
- 6: delete nodes in *B* from the graph

Only for making a blossom expansion easier.

- 1: trace pred-indices of i and j to identify a blossom B
- 2: create new node b and set $\bar{A}(b) \leftarrow \bigcup_{x \in B} \bar{A}(x)$
- 3: label *b* even and add to *list*
- 4: update $\bar{A}(j) \leftarrow \bar{A}(j) \cup \{b\}$ for each $j \in \bar{A}(b)$
- 5: form a circular double linked list of nodes in B

6: delete nodes in *B* from the graph

Only delete links from nodes not in *B* to *B*.

When expanding the blossom again we can recreate these links in time O(m).

- A contraction operation can be performed in time O(m).
 Note, that any graph created will have at most m edges.
- The time between two contraction-operation is basically a BFS/DFS on a graph. Hence takes time O(m).
- There are at most n contractions as each contraction reduces the number of vertices.
- The expansion can trivially be done in the same time as needed for all contractions.
- An augmentation requires time $\mathcal{O}(n)$. There are at most n of them.
- In total the running time is at most

$$n \cdot (\mathcal{O}(mn) + \mathcal{O}(n)) = \mathcal{O}(mn^2)$$
.

- A contraction operation can be performed in time O(m).
