# 17 Bipartite Matching via Flows

# Which flow algorithm to use?

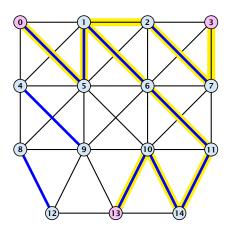

- Generic augmenting path:  $\mathcal{O}(m \operatorname{val}(f^*)) = \mathcal{O}(mn)$ .
- ▶ Capacity scaling:  $\mathcal{O}(m^2 \log C) = \mathcal{O}(m^2)$ .

# **Augmenting Paths in Action**

# 18 Augmenting Paths for Matchings

#### Definitions.

- Given a matching M in a graph G, a vertex that is not incident to any edge of M is called a free vertex w.r..t. M.
- For a matching M a path P in G is called an alternating path if edges in M alternate with edges not in M.
- ► An alternating path is called an augmenting path for matching M if it ends at distinct free vertices.

#### Theorem 1

A matching M is a maximum matching if and only if there is no augmenting path w.r.t. M.

# 18 Augmenting Paths for Matchings

#### Proof.

- $\Rightarrow$  If M is maximum there is no augmenting path P, because we could switch matching and non-matching edges along P. This gives matching  $M' = M \oplus P$  with larger cardinality.
- $\leftarrow$  Suppose there is a matching M' with larger cardinality. Consider the graph H with edge-set  $M' \oplus M$  (i.e., only edges that are in either M or M' but not in both).

Each vertex can be incident to at most two edges (one from M and one from M'). Hence, the connected components are alternating cycles or alternating path.

As |M'| > |M| there is one connected component that is a path P for which both endpoints are incident to edges from M'. P is an alternating path.

# 18 Augmenting Paths for Matchings

### Algorithmic idea:

As long as you find an augmenting path augment your matching using this path. When you arrive at a matching for which no augmenting path exists you have a maximum matching.

### Theorem 2

Let G be a graph, M a matching in G, and let u be a free vertex w.r.t. M. Further let P denote an augmenting path w.r.t. M and let  $M' = M \oplus P$  denote the matching resulting from augmenting M with P. If there was no augmenting path starting at u in Mthen there is no augmenting path starting at u in M'.

The above theorem allows for an easier implementation of an augmentling path algorithm. Once we checked for augmenting paths starting from u we don't have to check for such paths in future rounds.

554

### **Proof**

- Assume there is an augmenting path P' w.r.t. M' starting at u.
- ▶ If P' and P are node-disjoint, P' is also augmenting path w.r.t.  $M(\mathcal{E})$ .

18 Augmenting Paths for Matchings

- Let u' be the first node on P' that is in P, and let e be the matching edge from M' incident to u'.
- ightharpoonup u' splits P into two parts one of which does not contain e. Call this part  $P_1$ . Denote the sub-path of P'from u to u' with  $P'_1$ .
- ▶  $P_1 \circ P_1'$  is augmenting path in M (§).

# How to find an augmenting path?

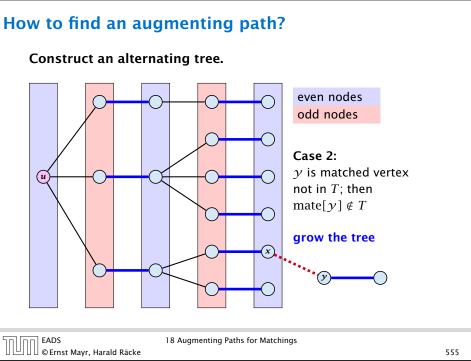

## Construct an alternating tree.

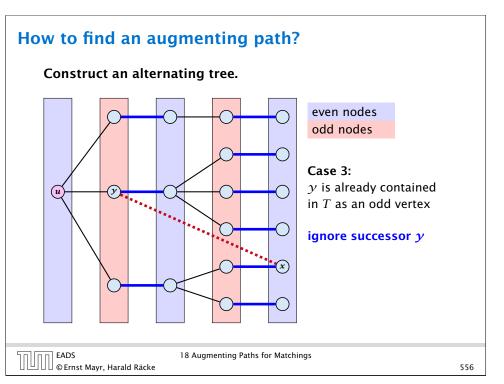

even nodes odd nodes

### Case 1: $\nu$ is free vertex not contained in T

you found alternating path

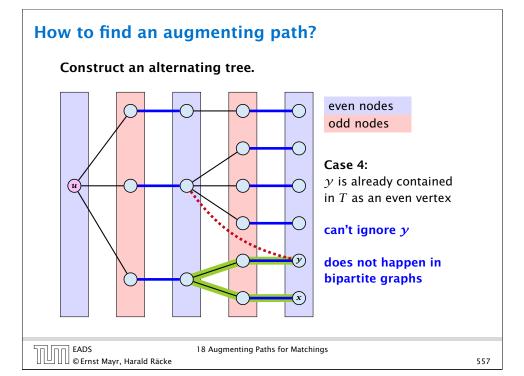

#### **Algorithm 50** BiMatch(*G*, *match*) 1: **for** $x \in V$ **do** $mate[x] \leftarrow 0$ ; 2: $r \leftarrow 0$ ; free $\leftarrow n$ ; 3: while $free \ge 1$ and r < n do $r \leftarrow r + 1$ if mate[r] = 0 then 5: **for** i = 1 **to** m **do** $parent[i'] \leftarrow 0$ 6: 7: $O \leftarrow \emptyset$ ; O. append(r); aug $\leftarrow$ false; while aug = false and $Q \neq \emptyset$ do $x \leftarrow O.$ dequeue(); 9: 10: for $y \in A_x$ do 11: if $mate[\gamma] = 0$ then 12: augm(mate, parent, y);13: *aug* ← true; 14: $free \leftarrow free - 1$ : 15: else if parent[y] = 0 then 16: $parent[y] \leftarrow x;$ 17: 18: Q. enqueue( $mate[\gamma]$ );

graph  $G = (S \cup S', E)$   $S = \{1, ..., n\}$   $S' = \{1', ..., n'\}$ start with an empty matching

free: number of unmatched nodes in S r: root of current tree
as long as there are unmatched nodes and we did not yet try to grow from all nodes we continue

# 19 Weighted Bipartite Matching

# Weighted Bipartite Matching/Assignment

- ▶ Input: undirected, bipartite graph  $G = L \cup R$ , E.
- ▶ an edge  $e = (\ell, r)$  has weight  $w_e \ge 0$
- find a matching of maximum weight, where the weight of a matching is the sum of the weights of its edges

# Simplifying Assumptions (wlog [why?]):

- assume that |L| = |R| = n
- ▶ assume that there is an edge between every pair of nodes  $(\ell, r) \in V \times V$
