Bipartite Matching

- ▶ Input: undirected, bipartite graph $G = (L \uplus R, E)$.
- ▶ $M \subseteq E$ is a matching if each node appears in at most one edge in M.
- Maximum Matching: find a matching of maximum cardinality

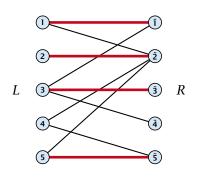

Matching

- ▶ Input: undirected graph G = (V, E).
- ▶ $M \subseteq E$ is a matching if each node appears in at most one edge in M.
- Maximum Matching: find a matching of maximum cardinality

Bipartite Matching

- ▶ Input: undirected, bipartite graph $G = (L \uplus R, E)$.
- ▶ $M \subseteq E$ is a matching if each node appears in at most one edge in M.
- Maximum Matching: find a matching of maximum cardinality

16 Definition

Bipartite Matching

- ▶ A matching M is perfect if it is of cardinality |M| = |V|/2.
- For a bipartite graph $G = (L \uplus R, E)$ this means |M| = |L| = |R| = n.

Proof

Max cardinality matching in $G \le \text{value}$ of maxflow in G'

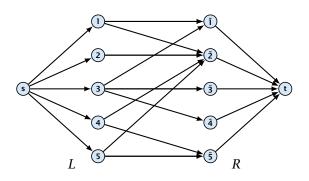

- Given a maximum matching M of cardinality k.
- ightharpoonup Consider flow f that sends one unit along each of k paths.
- ightharpoonup f is a flow and has cardinality k.

17 Bipartite Matching via Flows

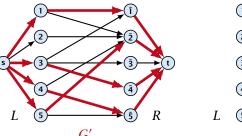

- ▶ Input: undirected, bipartite graph $G = (L \uplus R \uplus \{s, t\}, E')$.
- ▶ Direct all edges from *L* to *R*.
- Add source s and connect it to all nodes on the left.
- Add t and connect all nodes on the right to t.
- All edges have unit capacity.

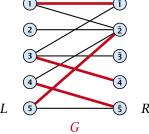

Proof

Max cardinality matching in $G \ge \text{value of maxflow in } G'$

- $\blacktriangleright \ \, \mathsf{Let} \, f \, \, \mathsf{be} \, \, \mathsf{a} \, \, \mathsf{maxflow} \, \, \mathsf{in} \, \, G' \, \, \mathsf{of} \, \, \mathsf{value} \, \, k$
- ▶ Integrality theorem $\Rightarrow k$ integral; we can assume f is 0/1.
- ► Consider M= set of edges from L to R with f(e) = 1.
- lacktriangle Each node in L and R participates in at most one edge in M.
- ightharpoonup |M| = k, as the flow must use at least k middle edges.
