### **Definition 1**

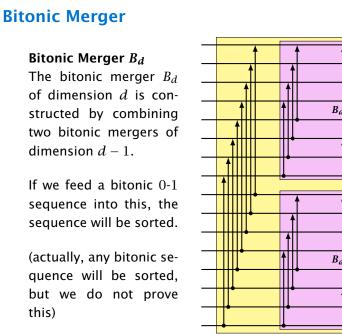

this)

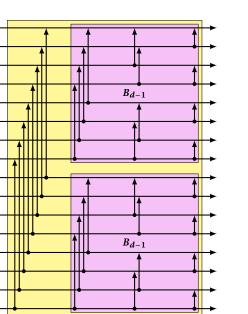

A 0-1 sequence *S* is bitonic if it can be written as the concatenation of subsequences  $S_1$  and  $S_2$  such that either

- $\blacktriangleright$  S<sub>1</sub> is monotonically increasing and S<sub>2</sub> monotonically decreasing, or
- $\triangleright$  S<sub>1</sub> is monotonically decreasing and S<sub>2</sub> monotonically increasing.

Note, that this just defines bitonic 0-1 sequences. Bitonic sequences are defined differently.

## **Bitonic Merger**

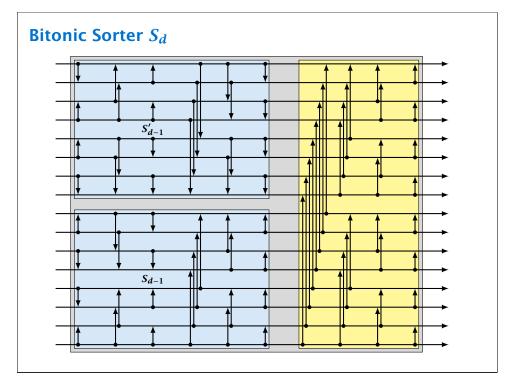

If we feed a bitonic 0-1 sequence S into the network on the right we obtain two bitonic sequences  $S_T$  and  $S_B$  s.t.

- **1.**  $S_B \leq S_T$  (element-wise)
- **2.**  $S_B$  and  $S_T$  are bitonic

### Proof:

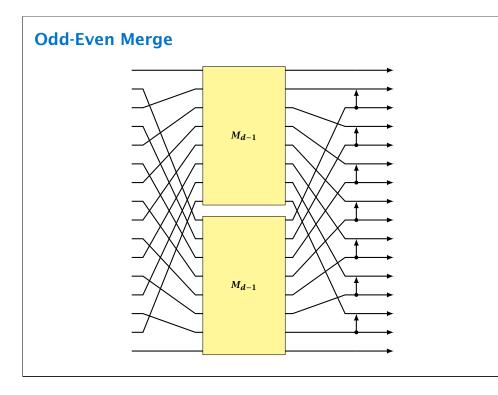

- ▶ assume wlog. *S* more 1's than 0's.
- assume for contradiction two 0s at same comparator  $(i, j = i + 2^d)$ 
  - everything 0 btw i and j means we have more than 50% zeros (≠).
  - all 1s btw. i and j means we have less than 50% ones (2).
  - ▶ 1 btw. *i* and *j* and elsewhere means S is not bitonic ( $\neq$ ).

# Bitonic Merger: $(n = 2^d)$ • comparators: $C(n) = 2C(n/2) + n/2 \Rightarrow C(n) = O(n \log n)$ . • depth: $D(n) = D(n/2) + 1 \Rightarrow D(d) = O(\log n)$ . Bitonic Sorter: $(n = 2^d)$ • comparators: $C(n) = 2C(n/2) + O(n \log n) \Rightarrow$ $C(n) = O(n \log^2 n)$ . • depth: $D(n) = D(n/2) + \log n \Rightarrow D(n) = \Theta(\log^2 n)$ .

## **Odd-Even Merge**

How to merge two sorted sequences?  $A = (a_1, a_2, ..., a_n), B = (b_1, b_2, ..., b_n), n$  even.

Split into odd and even sequences:

 $A_{\text{odd}} = (a_1, a_3, a_5, \dots, a_{n-1}), A_{\text{even}} = (a_2, a_4, a_6, \dots, a_n)$  $B_{\text{odd}} = (b_1, b_3, b_5, \dots, b_{n-1}), B_{\text{even}} = (b_2, b_4, b_6, \dots, b_n)$ 

Let

 $X = merge(A_{odd}, B_{odd})$  and  $Y = merge(A_{even}, B_{even})$ 

Then

 $S = (x_1, \min\{x_2, y_1\}, \max\{x_2, y_1\}, \min\{x_3, y_2\}, \dots, y_n)$

8 Sorting Networks

#### **Theorem 2**

There exists a sorting network with depth  $O(\log n)$  and  $O(n \log n)$  comparators.
